1 Insertion Graphics/Pictures/Figures in a Document

1.1 Inserting the Graphics/Pictures/Figures side-by-side

(a) Image

(b) Figure

(c) Graph

Figure 1: Three simple Graphics/Pictures/Figures in a Document arranged side-by-side

1.2 Wrapping text around figures

There are several ways to plot a function of two variables, depending on the information you are interested in. For instance, if you want to see the mesh of a function, you can use a surface plot. This helps visualize derivatives and variations clearly. Continue writing more text here so that it properly wraps around the image. Add a few more lines to ensure proper wrapping and alignment of the figure with the text content.

More explanation text is added here so that the wrapping effect becomes clearly visible. Without sufficient text, LaTeX will push the image downward instead of wrapping it properly.

On the other side, if you are only interested in certain values, you can use the contour plot. This type of plot shows lines of equal value and helps understand gradients clearly. Continue writing more text here so that it wraps properly around the image. You need enough content for the wrapping effect to be visible and stable.

Figure 3: Wrapped Figure

Adding more lines ensures the text flows nicely around the second image. This avoids the issue of the image moving downward and maintains a clean layout in the document. On the other side, if you are only interested in certain values, you can use the contour plot. This type of plot shows lines of equal value and helps understand gradients clearly.
