1 Introduction

For disaster management, uncertainty handling is the main key problem. But, in Joint Service deployment and Requests Allocation (JSR) domain, research work mainly uses deterministic optimization [?, ?, ?].

Lyapunov optimization [?], stochastic optimization, replication of services, forecasting of user requests using ML without considering uncertainty.

2 Experiment Setup and Performance Parameters

To demonstrate the efficiency of the proposed approaches, we simulate an urban disaster scenario [?]. We use IBM CPLEX Optimizer [?].
